

V1 Controller – Installation Instructions

Porsche (997/987)

- I. Remove key from ignition switch.
- II. Locate the stock PASM module. It is located above and slightly forward of the carpeted trim panel nearest to the passenger right foot. There's no need to remove the trim panel. Just reach your hand above the trim panel then slight forward and you'll feel the flat surface of the PASM module.

- III. Once you have your fingers on the flat surface of the PASM module, follow downward and you'll feel the plastic locking tab. Gently push down on the locking tab and the PASM module will fall out of the retaining bracket.

- IV. Carefully unplug the electrical connector from the PASM module and transfer the connector to the DSC module. Make sure the connector is plugged in all the way and is secured.

- V. To install the DSC module onto the retaining bracket simply line up the upper tab and the bottom will snap into the locking tab.
