

V2 Controller Installation Instructions

Dodge Viper (gen V)

No Tools Required

To install the DSC Sport Controller you will need to access the trunk area and lift off the carpeted cover in the trunk. This will provide access to the suspension module you will be replacing. There are several wire loom clips that need to be slid off their respective posts to make removal easy. Remove connectors from module by sliding locking mechanisms toward the outside of the vehicle. As you slide locking tabs the connector will back out on its own. Always be careful not to put stress on pins, the connectors should back straight out of their receptacle. Replace module with DSC Sport Controller and reinstall connectors. Replace wire loom clips.

If using active exhaust, run (2) wires from exhaust vacuum solenoid to DSC Sport Controller. Zip tie along brake lines to grommet nearest to DSC Sport controller. Feed thru grommet and splice at controller and solenoid. If not adding connectors, solder connections and cover in heat shrink wrap or electrical tape.
